

PK-Term 3.x Integration with HamHub Plug-In Modules

PK-Term 3.0.1 and higher has built in support for HamHub Plug-In Modules. To install, follow the procedure that best fits your case:

Installing a new module:

1. Exit PK-Term.
2. Copy the new module (ex. MT63.dll) to the folder “C:\Program Files\PKTerm99”. If you installed PK-Term to another folder, use that folder.
3. Restart PK-Term.

Upgrading modules:

1. Exit PK-Term.
2. Copy the new module (ex. MT63.dll) to the folder “C:\Program Files\PKTerm99”. If you installed PK-Term to another folder, use that folder. If asked if you want to overwrite, say YES.
3. Restart PK-Term.

Once installed, you can select the module by:

1. Start PK-Term
2. Select HF Non-Packet Mode. You may do this by selecting it in the drop box up by the menu, or selecting it on the File menu.
3. Select your new module. You may do this by selecting it in the drop box up by the menu, or selecting it on the Mode menu.
4. If it is the first use, configure the module by selecting “Soundcard Mode Setup” on the File menu. The settings are defined in the PDF file that accompanies the Module.
5. You are ready to go!

Note: These procedures assume that you have used Packet modes and so are familiar with PK-Term operations.
